	Urgent	Not Urgent
Important	**Do (MVP)** - Load puzzle from text file and display it + its rule/instruction in the terminal - Read player commands (like "add <->", "remove <->"), validate them & check when the puzzle is solved - Classify each move as an add or a subtract - Log results to a CSV with an anonymous participant ID	**Schedule (For V2.0+)** - End -of-session summary report - Color coding in terminal with ANSI code - Timing / improvement metrics - Send puzzles to an LLM through its API & parse reply into moves - Human vs. AI comparison report
Not Important	**Delegate (Use a library)** - Parse JSON with Gson, or with simple String methods - Scanner for input - Buffered Reader/ Print Writer for files - "java.net.http.HttpClient" for API requests (If I get to schedule items)	**Delete (Cut it)** - A second puzzle type (palindrome or grid) - Testing multiple different LLMs - "Improve" vs. neutral instruction wording variants (too complex) - Statistical significance analysis (probably not enough subjects) - Comparison to some aggregate of all scores in user summary/leader board - Nice GUI
